

CROP DATA SHEET · FORAGE

Alfalfa

Yield gains every cutting, with no drop in relative feed value.

+25% YIELD, LATE-SEASON FOLIAR
NO DECREASE IN RELATIVE FEED VALUE

+7-12%

SEED & IN-FURROW

Gain range for in-furrow and seed-treated cuttings.

+13-25%

FOLIAR, APR-AUG

Gain range for foliar application through the season.

No loss

FEED VALUE

Relative feed value held steady across cuttings.

WHEN TO APPLY

Apply by **seed treatment**, **in-furrow** at planting, or as a **foliar pass**. Earlier is better, but a foliar pass well into the **vegetative stage** still delivers a real benefit — it is never too late to start.

HOW THE PROGRAM WORKS

Holds up under stress

Living inputs help the plant manage heat, drought and salinity, so more of the season goes into the crop.

More growth

Symbiotic signalling lifts growth rate and nutrient-use efficiency across the canopy.

Healthier root zone

A richer root environment frees up soil nutrients, so the crop leans less on synthetic NPK.

FIELD-TRIAL EVIDENCE

Alfalfa is part of the verified trial record. Figures are from independent replicated trials with cooperator identities withheld, shown as ranges, never a guarantee for a given field.

YEAR	REGION	APPLICATION	RESULT
Multi-yr	Temperate	Seed treatment	+9.9–10.8% / cutting (p<0.05)
Multi-yr	Arid	Foliar pass	+13.6–25.0% (p<0.05)
Multi-yr	Temperate / arid	In-furrow	+7.0–12.3% (p<0.05)

Independent contract-research trials; cooperator names withheld. Figures are verified ranges, never a guarantee for a given field.
