

CROP DATA SHEET · CEREAL

Rice

Holds yield through a hot, dry season, with less fertilizer.

+13–30% **YIELD, STRESS SEASON**
INDEPENDENT TRIALS, DRY YEAR

+13–30%

STRESS SEASON

Gain range in a hot, dry season vs. untreated.

30–50%

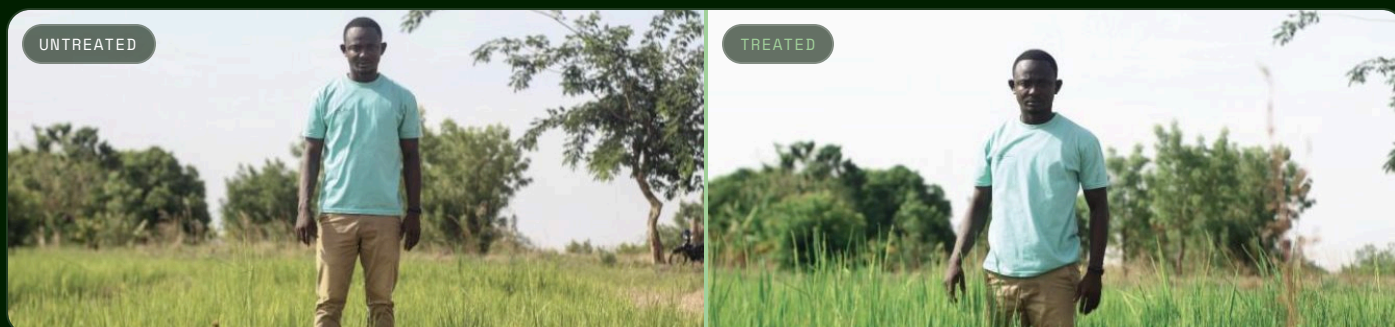

LESS NITROGEN

Matched yield at reduced N (Harman 2011).

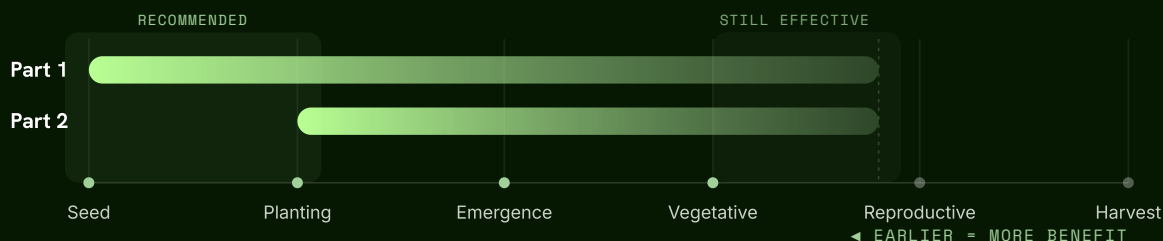

Improved

TILLERING & VIGOR

More tillers and stronger early vigor.

WHEN TO APPLY

Apply by **seed treatment**, **in-furrow** at planting, or as a **foliar pass**. Earlier is better, but a foliar pass well into the **vegetative stage** still delivers a real benefit — it is never too late to start.

HOW THE PROGRAM WORKS

Holds up under stress

Living inputs help the plant manage heat, drought and salinity, so more of the season goes into the crop.

More growth

Symbiotic signalling lifts growth rate and nutrient-use efficiency across the canopy.

Healthier root zone

A richer root environment frees up soil nutrients, so the crop leans less on synthetic NPK.

FIELD-TRIAL EVIDENCE

Rice is part of the verified trial record. Figures are from independent replicated trials with cooperator identities withheld, shown as ranges, never a guarantee for a given field.

YEAR	REGION	APPLICATION	RESULT
2023	Texas	Seed treatment	+29.7% (stress season)
2024	Texas	Foliar pass	+4.9%
Multi-yr	Sub-Saharan	On-farm	+28-75%, high win rate

Independent contract-research trials; cooperator names withheld. Figures are verified ranges, never a guarantee for a given field.
